Name of the Vulnerable Software and Affected Versions DevExpress (affected versions not specified)

Description This issue allows remote attackers to execute arbitrary code on affected installations. Authentication is required to exploit this issue. The flaw exists within the SafeBinaryFormatter library due to the lack of proper validation of user-supplied data, resulting in deserialization of untrusted data. An attacker can leverage this issue to execute code in the context of the service account.

Recommendations At the moment, there is no information about a newer version that contains a fix for this issue.

Fix

Deserialization of Untrusted Data
