Challenge

Multiple vulnerabilities ([CVE-2022-26500](#), [CVE-2022-26501](#)) in Veeam Backup & Replication allow executing malicious code remotely without authentication. This may lead to gaining control over the target system.

Severity: Critical **CVSS v3 score:** 9.8

Cause

The Veeam Distribution Service (*TCP 9380 by default*) allows unauthenticated users to access internal API functions. A remote attacker may send input to the internal API which may lead to uploading and executing of malicious code.

Solution

Patches are available for the following Veeam Backup & Replication versions:

- ****11a** [*\(build 11.0.1.1261 P20220302\)*](#)
- ****10a** [*\(build 10.0.1.4854 P20220304\)*](#)

Notes:

- The patch must be installed on the Veeam Backup & Replication server. Managed servers with Veeam Distribution Service will be updated automatically after installing the patch.
- All new deployments of Veeam Backup & Replication version 11a and 10a installed using the ISO images dated 20220302 or later are not vulnerable.
- If you are using Veeam Backup & Replication 9.5, please [upgrade](#) to a supported product version.
- **Temporary mitigation of the vulnerabilities:** Stop and disable the Veeam Distribution Service. The Veeam Distribution Service is installed on the Veeam Backup & Replication server and servers specified as [distribution servers in Protection Groups](#).

More Information

These vulnerabilities were reported by Nikita Petrov ([Positive Technologies](#)).
