Article series on .NET deserialization vulnerabilities

Speaking of deserialization vulnerabilities, one cannot avoid mentioning the Java and PHP languages that were extremely popular in earlier years; today there are already many analysis articles online, while .Net deserialization attacks are relatively low key and the articles leave much to be desired. After recently consulting many sources, the author has put together the following course. Friends who like it can follow our `` `dot.Net` `` public account, and let us discuss .NET security together.

.NET Security Matrix Planet

Since its creation, the dotNet Security Matrix Planet has focused on offensive and defensive security technology in the .NET field, positioning itself as a high-quality offensive-and-defensive security planet community, and it has also gained the support and trust of many masters. Through the planet it deeply connects the masters who are in the circle, together pushing high-quality .NET security forward. The planet gathers offensive-and-defensive security experts from all industries, and every day shares .NET security technical material as well as discussing and answering all kinds of technical questions. Many high-quality .NET security resources are published in the community, which one may say are rarely seen on the market and are all solid material. The topics include ``.NET TrickswebshellC#`` and so on. Later we will also put effort into building supporting learning resources such as special issues and videos, guiding step by step to deepen the improvement of offensive and defensive security technology, as well as job referrals and other services

.NET Security Matrix public account

[dotNet Security Matrix] - focused on Microsoft .NET security technology, it once serialized an original course on the ten major .NET deserialization vulnerabilities, and follows the various red-and-blue offense-and-defense technologies derived from .NET. The shared content is not limited to .NET code auditing, the latest .NET vulnerability analyses, deserialization vulnerability research, interesting .NET security tricks, .NET open source

software sharing, the .NET ecosystem and other hot topics. May you learn real solid material here, and may we together push the .NET security atmosphere to roll up
