Challenge

Vulnerability ([CVE-2022-26503](#)) in Veeam Agent for Microsoft Windows allows local privilege escalation. An attacker who successfully exploited this vulnerability could run arbitrary code with LOCAL SYSTEM privileges.

Severity: High **CVSS v3 score:** 7.8

Cause

Veeam Agent *for Microsoft Windows* uses Microsoft .NET data serialization mechanisms. A local user may send malicious code to the network port opened by Veeam Agent *for Microsoft Windows* Service (TCP 9395 by default), which will not be deserialized properly.

Solution

This vulnerability is fixed in the following Veeam Agent *for Microsoft Windows* patched releases:

- ****5*** (build 5.0.3.4708)*
- ****4*** (build 4.0.2.2208)*

Notes:

- For standalone Veeam Agent *for Microsoft Windows* deployments, the patched release must be installed manually on each machine.
- For Veeam Agent *for Microsoft Windows* deployments managed by Veeam Backup & Replication, the update can be performed from the Veeam Backup & Replication Console after installing the corresponding Veeam Backup & Replication cumulative patches ([10a](#) | [11a](#)).

If a [Auto-update backup agent](#) is enabled, the Veeam Agent *for Microsoft Windows* deployments will be updated automatically. Otherwise, the update must be [manually triggered](#) in the Veeam Backup & Replication console.

- If you are using a version of Veeam Agent *for Microsoft Windows* prior to 4, please upgrade to a supported version.

More Information

This vulnerability was reported by Nikita Petrov ([Positive Technologies](#)).

If this KB article did not resolve your issue or you need further assistance with Veeam software, please create a [Veeam Support Case](#).
