BinaryServerFormatterSink Class

Definition

Namespace: [System.Runtime.Remoting.Channels](#) Assembly: System.Runtime.Remoting.dll

Important

Some information relates to prerelease product that may be substantially modified before it's released. Microsoft makes no warranties, express or implied, with respect to the information provided here.

Provides the implementation for a server formatter sink that uses the [BinaryFormatter](#).

```
public ref class BinaryServerFormatterSink :  
    System::Runtime::Remoting::Channels::IServerChannelSink
```

```
public class BinaryServerFormatterSink :  
    System.Runtime.Remoting.Channels.IServerChannelSink
```

```
type BinaryServerFormatterSink = class
    interface IServerChannelSink
    interface IChannelSinkBase
```

```
Public Class BinaryServerFormatterSink
    Implements IServerChannelSink
```

Inheritance

[Object](#)

BinaryServerFormatterSink

Implements

[IChannelSinkBase](#) [IServerChannelSink](#)

Remarks

The request stream propagates from the server transport sink through the server channel sinks until it reaches the appropriate formatter sink. The formatter sink deserializes the message and passes it through the pipeline. A special dispatch sink is inserted at the end of the channel sink chain by the [ChannelServices.CreateServerChannelSinkChain](#) method, which is called by server channels to create the server channel sink chains. When the message reaches the dispatch sink, the dispatch sink passes the message to the remoting infrastructure.

The following table shows the sink configuration properties that can be specified for the current sink provider.

Property	Description
<code>includeVersions</code>	Specifies whether the formatter will include versioning information. Values <code>true</code> or <code>false</code> .
<code>strictBinding</code>	Indicates that a receiving formatter will first try to identify the type using complete version information if it exists before using only the type name and assembly name without version information. Values <code>true</code> or <code>false</code> . The default for both system-provided formatters is <code>false</code> .
<code>typeFilterLevel</code>	A string value that specifies the level of automatic deserialization that a server channel attempts. Supported values are <code>Low</code> (the default) and <code>Full</code> . For details about deserialization levels, see Automatic Deserialization in .NET Framework Remoting .

This property is supported only by the .NET Framework version 1.1 on the following platforms: Windows 98, Windows NT 4.0, Windows Millennium Edition, Windows 2000, Windows XP Home Edition, Windows XP Professional, and Windows Server 2003 family.

Important

Using an instance of this object with untrusted data or across an unsecure channel is a security risk. Use this object only with trusted data and across a secure channel. For more information, see [Validate All Inputs](#).

Constructors

| Name | Description | | | [BinaryServerFormatterSink\(BinaryServerFormatterSink+Protocol, IServerChannelSink, IChannelReceiver\)](#) |

Initializes a new instance of the [BinaryServerFormatterSink](#) class.

| |

Properties

| Name | Description | | | [NextChannelSink](#) |

Gets the next [IServerChannelSink](#) in the sink chain.

| | | [Properties](#) |

Gets a [IDictionary](#) of properties for the current channel sink.

| | | [TypeFilterLevel](#) |

Gets or sets the `TypeFilterLevel` value of automatic deserialization that the `BinaryServerFormatterSink` performs.

| |

Methods

| Name | Description | | | [AsyncProcessResponse\(IServerResponseChannelSinkStack, Object, IMessage, ITransportHeaders, Stream\)](#) |

Requests processing of the response from a method call that is sent asynchronously.

| | | [Equals\(Object\)](#) |

Determines whether the specified object is equal to the current object.

(Inherited from [Object](#)) | | | [GetHashCode\(\)](#) |

Serves as the default hash function.

(Inherited from [Object](#)) | | | [GetResponseStream\(IServerResponseChannelSinkStack, Object, IMessage, ITransportHeaders\)](#) |

Returns the [Stream](#) onto which the provided response message is to be serialized.

| | | [GetType\(\)](#) |

Gets the [Type](#) of the current instance.

(Inherited from [Object](#)) | | | [MemberwiseClone\(\)](#) |

Creates a shallow copy of the current [Object](#).

(Inherited from [Object](#)) | | | [ProcessMessage\(IServerChannelSinkStack, IMessage, ITransportHeaders, Stream, IMessage, ITransportHeaders, Stream\)](#) |

Requests message processing from the current sink.

||| [ToString\(\)](#) |

Returns a string that represents the current object.

(Inherited from [Object](#)) ||

Applies to
