ConvertFrom-CliXml

Module: [Microsoft.PowerShell.Utility Module](#)

Converts a CliXml-formatted string to a custom **PSObject**.

Syntax

Default (Default)

```
ConvertFrom-CliXml  
  [-InputObject] <String>  
  [<CommonParameters>]
```

Description

The `ConvertFrom-CliXml` cmdlet converts strings that are formatted as Common Language Infrastructure (CLI) XML to a custom **PSObject**. This command is similar to `Import-Clixml`,

but it doesn't read from a file. Instead, it takes a string as input.

The newly deserialized objects aren't live objects. They're a snapshot of the objects at the time of serialization. The deserialized objects include properties but no methods. The **pstypenames** property contains the original type name prefixed with `Deserialized.`

This cmdlet was introduced in PowerShell 7.5-preview.4.

Examples

Example 1 - Convert a process object to CliXml and back

This example shows the result of converting a process object to CliXml and back. First, the current process is stored in the variable `$process`. The **pstypenames** property of the process object shows that the object is of type **System.Diagnostics.Process**. The next command displays the count for each type of member in the process object.

```
$process = Get-Process -Id $PID
$process.pstypenames
```

```
System.Diagnostics.Process
System.ComponentModel.Component
System.MarshalByRefObject
System.Object
```

```
$process | Get-Member | Group-Object MemberType | Select-Object Name, Count
```

Name	Count
----	-----
AliasProperty	7
CodeProperty	1
Property	52
NoteProperty	1
ScriptProperty	8
PropertySet	2
Method	19
Event	4

```
$xml = $process | ConvertTo-CliXml
$fromXML = ConvertFrom-CliXml $xml
$fromXML.pstypenames
```

```
Deserialized.System.Diagnostics.Process
Deserialized.System.ComponentModel.Component
Deserialized.System.MarshalByRefObject
Deserialized.System.Object
```

```
$fromXML | Get-Member | Group-Object MemberType | Select-Object Name, Count
```

Name	Count
----	-----
Property	46
NoteProperty	17
PropertySet	2
Method	2

Next, the process object is converted to CliXml and back. The type of the new object is prefixed with `Deserialized`. The count of members in the new object is different from the original object.

Parameters

-InputObject

The object containing a CliXml-formatted string to be converted.

Parameter properties

| Type: | [String](#) | | | Default value: | None | | | Supports wildcards: | False | | | DontShow: | False | |

Parameter sets

(All)

| Position: | 0 | | | Mandatory: | True | | | Value from pipeline: | True | | | Value from pipeline by property name: | False | | | Value from remaining arguments: | False | |

CommonParameters

This cmdlet supports the common parameters: -Debug, -ErrorAction, -ErrorVariable, -InformationAction, -InformationVariable, -OutBuffer, -OutVariable, -PipelineVariable, -ProgressAction, -Verbose, -WarningAction, and -WarningVariable. For more information, see [about_CommonParameters](#).

Inputs

String

Outputs

Object

- [ConvertTo-CliXml](#)
- [ConvertTo-Xml](#)
- [Export-Clixml](#)
- [Import-Clixml](#)
