ObjectStateFormatter.Deserialize Method

Definition

Namespace: [System.Web.UI](#) Assembly: System.Web.dll

Important

Some information relates to prerelease product that may be substantially modified before it's released. Microsoft makes no warranties, express or implied, with respect to the information provided here.

Deserializes an object state graph from serialized form.

Overloads

| Name | Description | | | [Deserialize\(Stream\)](#) |

Deserializes an object state graph from its binary-serialized form that is contained in the specified [Stream](#) object.

| | | [Deserialize\(String\)](#) |

Deserializes an object state graph from its serialized base64-encoded string form.

Remarks

Important

Calling this method with untrusted data is a security risk. Call this method only with trusted data. For more information, see [Validate All Inputs](#).

Deserialize(Stream)

Deserializes an object state graph from its binary-serialized form that is contained in the specified [Stream](#) object.

```
public:  
    System::Object ^ Deserialize(System::IO::Stream ^ inputStream);
```

```
public object Deserialize(System.IO.Stream inputStream);
```

```
member this.Deserialize : System.IO.Stream -> obj
```

```
Public Function Deserialize (inputStream As Stream) As Object
```

Parameters

inputStream [Stream](#)

A [Stream](#) that the [ObjectStateFormatter](#) deserializes into an initialized `object`.

Returns

[Object](#)

An object that represents a deserialized object state graph.

Exceptions

[ArgumentNullException](#)

The specified `inputStream` is `null`.

[ArgumentException](#)

An exception occurs during deserialization of the [Stream](#). The exception message is appended to the message of the [ArgumentException](#).

Examples

The following code example demonstrates how a class that derives from the [PageStatePersister](#) class initializes the [ViewState](#) collection. In this example, the [ViewState](#) collection has been assigned to the [First](#) field of a [Pair](#) object, and serialized to a file using the [ObjectStateFormatter](#) class. When the [Load](#) method is called, the [Deserialize\(Stream\)](#) method is used to deserialize view state from the file, and the [ViewState](#) property is initialized. This code example is part of a larger example provided for the [PageStatePersister](#) class.

```
//  
// Load ViewState and ControlState.  
//  
public override void Load()  
{  
    Stream stateStream = GetSecureStream();  
  
    // Read the state string, using the StateFormatter.  
    StreamReader reader = new StreamReader(stateStream);  
  
    IStateFormatter formatter = this.StateFormatter;  
    string fileContents = reader.ReadToEnd();  
  
    // Deserilize returns the Pair object that is serialized in  
    // the Save method.  
    Pair statePair = (Pair)formatter.Deserialize(fileContents);  
  
    ViewState = statePair.First;  
    ControlState = statePair.Second;  
    reader.Close();  
    stateStream.Close();  
}
```

```

'
' Load ViewState and ControlState.
'
Public Overrides Sub Load()

    Dim stateStream As Stream
    stateStream = GetSecureStream()

    ' Read the state string, using the StateFormatter.
    Dim reader As New StreamReader(stateStream)

    Dim serializedStatePair As String
    serializedStatePair = reader.ReadToEnd
    Dim statePair As Pair

    Dim formatter As IStateFormatter
    formatter = Me.StateFormatter

    ' Deserilize returns the Pair object that is serialized in
    ' the Save method.
    statePair = CType(formatter.Deserialize(serializedStatePair), Pair)

    ViewState = statePair.First
    ControlState = statePair.Second
    reader.Close()
    stateStream.Close()
End Sub

```

Remarks

Any object state graph that is serialized with the [Serialize](#) method can be deserialized with the [Deserialize](#) method. The [Deserialize\(Stream\)](#) method is used to restore an object state graph stored in a [Stream](#), such as a [FileStream](#).

Important

Calling this method with untrusted data is a security risk. Call this method only with trusted data. For more information, see [Validate All Inputs](#).

Applies to

Deserialize(String)

Deserializes an object state graph from its serialized base64-encoded string form.

```
public:  
System::Object ^ Deserialize(System::String ^ inputString);
```

```
public object Deserialize(string inputString);
```

```
member this.Deserialize : string -> obj
```

```
Public Function Deserialize (inputString As String) As Object
```

Parameters

inputString [String](#)

A string that the [ObjectStateFormatter](#) deserializes into an initialized object.

Returns

[Object](#)

An object that represents a deserialized object state graph.

Exceptions

[ArgumentNullException](#)

The specified `inputString` is `null` or has a [Length](#) of 0.

[ArgumentException](#)

The serialized data is invalid.

[HttpException](#)

The machine authentication code (MAC) validation check that is performed when deserializing view state fails.

Examples

The following code example demonstrates how to implement a method that deserializes a base64-encoded string and returns an [ICollection](#) collection of property settings. This code example relies on the property settings having been serialized with the [ObjectStateFormatter](#) class, as shown in the [Serialize\(Object\)](#) method.

```

private ICollection LoadControlProperties (string serializedProperties) {

    ICollection controlProperties = null;

    // Create an ObjectStateFormatter to deserialize the properties.
    ObjectStateFormatter formatter = new ObjectStateFormatter();

    // Call the Deserialize method.
    controlProperties = (ArrayList) formatter.Deserialize(serializedProperties);

    return controlProperties;
}

```

```

Private Function LoadControlProperties(serializedProperties As String) As ICollection

    Dim controlProperties As ICollection = Nothing

    ' Create an ObjectStateFormatter to deserialize the properties.
    Dim formatter As New ObjectStateFormatter()

    ' Call the Deserialize method.
    controlProperties = CType(formatter.Deserialize(serializedProperties), ArrayList)

    Return controlProperties
End Function 'LoadControlProperties

```

Remarks

Any object state graph that is serialized with the [Serialize](#) method can be deserialized with the [Deserialize](#) method. The [Deserialize\(String\)](#) method is used to restore an object state graph stored in base64-encoded string form.

Important

Calling this method with untrusted data is a security risk. Call this method only with trusted data. For more information, see [Validate All Inputs](#).
