RunInstallerAttribute Class

Definition

Namespace: [System.ComponentModel](#) Assemblies:netstandard.dll,

System.ComponentModel.TypeConverter.dll

Assembly:System.ComponentModel.TypeConverter.dll Assembly:System.dll

Assembly:netstandard.dll Source:[RunInstallerAttribute.cs](#) Source:[RunInstallerAttribute.cs](#)

Source:[RunInstallerAttribute.cs](#) Source:[RunInstallerAttribute.cs](#) Source:[RunInstallerAttribute.cs](#)

Important

Some information relates to prerelease product that may be substantially modified before it's released. Microsoft makes no warranties, express or implied, with respect to the information provided here.

Specifies whether the Visual Studio Custom Action Installer or the [Installutil.exe \(Installer Tool\)](#) should be invoked when the assembly is installed.

```
public ref class RunInstallerAttribute : Attribute
```

```
[System.AttributeUsage(System.AttributeTargets.Class)]  
public class RunInstallerAttribute : Attribute
```

```
[<System.AttributeUsage(System.AttributeTargets.Class)>]  
type RunInstallerAttribute = class  
    inherit Attribute
```

```
Public Class RunInstallerAttribute  
    Inherits Attribute
```

Inheritance

[Object](#)

[Attribute](#)

RunInstallerAttribute

Attributes

[AttributeUsageAttribute](#)

Examples

The following example specifies that the installer should be run for `MyProjectInstaller`.

```
[RunInstallerAttribute(true)]  
ref class MyProjectInstaller: public Installer{  
    // Insert code here.  
};
```

```
[RunInstallerAttribute(true)]  
public class MyProjectInstaller : Installer {  
    // Insert code here.  
}
```

```

<RunInstallerAttribute(True)> _
Public Class MyProjectInstaller
    Inherits Installer

    ' Insert code here.
End Class

```

The next example creates an instance of `MyProjectInstaller`. Then it gets the attributes for the class, extracts the `RunInstallerAttribute`, and prints whether to run the installer.

```

int main()
{
    // Creates a new installer.
    MyProjectInstaller^ myNewProjectInstaller = gcnew MyProjectInstaller;

    // Gets the attributes for the collection.
    AttributeCollection^ attributes = TypeDescriptor::GetAttributes( myNewProjectInstaller
);

    /* Prints whether to run the installer by retrieving the
       * RunInstallerAttribute from the AttributeCollection. */
    RunInstallerAttribute^ myAttribute = dynamic_cast<RunInstallerAttribute^>(attributes[
RunInstallerAttribute::typeid ]);
    Console::WriteLine( "Run the installer? {0}", myAttribute->RunInstaller );
    return 0;
}

```

```

public static int Main() {
    // Creates a new installer.
    MyProjectInstaller myNewProjectInstaller = new MyProjectInstaller();

    // Gets the attributes for the collection.
    AttributeCollection attributes = TypeDescriptor.GetAttributes(myNewProjectInstaller);

    /* Prints whether to run the installer by retrieving the
       * RunInstallerAttribute from the AttributeCollection. */
    RunInstallerAttribute myAttribute =
        (RunInstallerAttribute)attributes[typeof(RunInstallerAttribute)];
    Console.WriteLine("Run the installer? " + myAttribute.RunInstaller.ToString());

    return 0;
}

```

```

Public Shared Function Main() As Integer
    ' Creates a new installer.
    Dim myNewProjectInstaller As New MyProjectInstaller()

    ' Gets the attributes for the collection.
    Dim attributes As AttributeCollection =
        TypeDescriptor.GetAttributes(myNewProjectInstaller)

    ' Prints whether to run the installer by retrieving the
    ' RunInstallerAttribute from the AttributeCollection.
    Dim myAttribute As RunInstallerAttribute = _
        CType(attributes(GetType(RunInstallerAttribute)), RunInstallerAttribute)

    Console.WriteLine(("Run the installer? " & myAttribute.RunInstaller.ToString()))
    Return 0
End Function 'Main

```

Remarks

If a class that inherits from [Installer](#) is marked with the [RunInstallerAttribute](#) set to `true`, Visual Studio's Custom Action Installer or the InstallUtil.exe will be invoked when the assembly is installed. Members marked with the [RunInstallerAttribute](#) set to `false` will not invoke an installer. The default is `true`.

Note

When you mark a property with the [RunInstallerAttribute](#) set to `true`, the value of this attribute is set to the constant member [Yes](#). For a property marked with the [RunInstallerAttribute](#) set to `false`, the value is [No](#). Therefore, when you want to check the value of this attribute in your code, you must specify the attribute as [RunInstallerAttribute.Yes](#) or [RunInstallerAttribute.No](#).

For more information, see [Attributes](#).

Constructors

Name	Description
RunInstallerAttribute(Boolean)	

Initializes a new instance of the [RunInstallerAttribute](#) class.

||

Fields

Name	Description	Default

Specifies the default visibility, which is [No](#). This `static` field is read-only.

||| [No](#) |

Specifies that the Visual Studio Custom Action Installer or the [Installutil.exe \(Installer Tool\)](#) should not be invoked when the assembly is installed. This `static` field is read-only.

||| [Yes](#) |

Specifies that the Visual Studio Custom Action Installer or the [Installutil.exe \(Installer Tool\)](#) should be invoked when the assembly is installed. This `static` field is read-only.

||

Properties

| Name | Description | || [RunInstaller](#) |

Gets a value indicating whether an installer should be invoked during installation of an assembly.

||| [TypeId](#) |

When implemented in a derived class, gets a unique identifier for this [Attribute](#).

(Inherited from [Attribute](#)) ||

Methods

| Name | Description | || [Equals\(Object\)](#) |

Determines whether the value of the specified [RunInstallerAttribute](#) is equivalent to the current [RunInstallerAttribute](#).

||| [GetHashCode\(\)](#) |

Generates a hash code for the current [RunInstallerAttribute](#).

||| [GetType\(\)](#) |

Gets the [Type](#) of the current instance.

(Inherited from [Object](#)) ||| [IsDefaultAttribute\(\)](#) |

Determines if this attribute is the default.

||| [Match\(Object\)](#) |

When overridden in a derived class, returns a value that indicates whether this instance equals a specified object.

(Inherited from [Attribute](#)) ||| [MemberwiseClone\(\)](#) |

Creates a shallow copy of the current [Object](#).

(Inherited from [Object](#)) ||| [ToString\(\)](#) |

Returns a string that represents the current object.

(Inherited from [Object](#)) ||

Explicit Interface Implementations

| Name | Description | | | [_Attribute.GetIDsOfNames\(Guid, IntPtr, UInt32, UInt32, IntPtr\)](#) |

Maps a set of names to a corresponding set of dispatch identifiers.

(Inherited from [Attribute](#)) | | | [_Attribute.GetTypeInfo\(UInt32, UInt32, IntPtr\)](#) |

Retrieves the type information for an object, which can be used to get the type information for an interface.

(Inherited from [Attribute](#)) | | | [_Attribute.GetTypeInfoCount\(UInt32\)](#) |

Retrieves the number of type information interfaces that an object provides (either 0 or 1).

(Inherited from [Attribute](#)) | | | [_Attribute.Invoke\(UInt32, Guid, UInt32, Int16, IntPtr, IntPtr, IntPtr, IntPtr\)](#) |

Provides access to properties and methods exposed by an object.

(Inherited from [Attribute](#)) | |
