SYSLIB0011: BinaryFormatter serialization is obsolete

Summarize this article for me

Due to [security vulnerabilities](#) in [BinaryFormatter](#), the following APIs were marked as obsolete in .NET 5. Using them in code generates warning or error `SYSLIB0011` at compile time.

- [System.Exception.SerializeObjectState](#)
- [BinaryFormatter.Serialize](#)
- [BinaryFormatter.Deserialize](#)
- [Formatter.Serialize\(Stream, Object\)](#)
- [Formatter.Deserialize\(Stream\)](#)
- [IFormatter.Serialize\(Stream, Object\)](#)
- [IFormatter.Deserialize\(Stream\)](#)

Starting in .NET 8, [BinaryFormatter.Serialize](#) and [BinaryFormatter.Deserialize](#) throw a [NotSupportedException](#) at runtime on most project types. In addition, `[PreserializedResourceWriter.AddBinaryFormattedResource(String, Byte[], String)]` ([https://learn.microsoft.com/en-us/dotnet/api/system.resources.extensions.preserializedresourcewriter.addbinaryformattedresource#system-resources-extensions-preserializedresourcewriter-addbinaryformattedresource\(system-string-system-byte\(\)-system-string\)](https://learn.microsoft.com/en-us/dotnet/api/system.resources.extensions.preserializedresourcewriter.addbinaryformattedresource#system-resources-extensions-preserializedresourcewriter-addbinaryformattedresource(system-string-system-byte()-system-string))) is obsolete as *warning*, and the following APIs are obsolete as *error*:

- [System.Runtime.Serialization.Formatter](#)
- [System.Runtime.Serialization.IFormatter](#)
- [System.Runtime.Serialization.Formatters.Binary.BinaryFormatter](#)

Workarounds

If you're using [BinaryFormatter](#), you should migrate away from it due to its security and reliability flaws. For more information, see [Deserialization risks in use of BinaryFormatter and related types](#) and [Preferred alternatives](#).

Suppress a warning

If you must use the obsolete APIs, you can suppress the warning/error in code or in your project file.

To suppress only a single violation, add preprocessor directives to your source file to disable and then re-enable the warning.

```
// Disable the warning.
#pragma warning disable SYSLIB0011

// Code that uses obsolete API.
// ...

// Re-enable the warning.
#pragma warning restore SYSLIB0011
```

To suppress all the `SYSLIB0011` warnings in your project, add a `<NoWarn>` property to your project file.

```
<Project Sdk="Microsoft.NET.Sdk">
  <PropertyGroup>
    ...
    <NoWarn>$(NoWarn);SYSLIB0011</NoWarn>
  </PropertyGroup>
</Project>
```

For more information, see [Suppress warnings](#).
