Reenlists a durable participant in a transaction.

```
public:  
    static System::Transactions::Enlistment ^ Reenlist(Guid resourceManagerIdentifier,  
cli::array <System::Byte> ^ recoveryInformation,  
System::Transactions::IEnlistmentNotification ^ enlistmentNotification);
```

```
public static System.Transactions.Enlistment Reenlist(Guid resourceManagerIdentifier,  
byte[] recoveryInformation, System.Transactions.IEnlistmentNotification  
enlistmentNotification);
```

```
static member Reenlist : Guid * byte[] * System.Transactions.IEnlistmentNotification ->  
System.Transactions.Enlistment
```

```
Public Shared Function Reenlist (resourceManagerIdentifier As Guid, recoveryInformation  
As Byte(), enlistmentNotification As IEnlistmentNotification) As Enlistment
```

Parameters

resourceManagerIdentifier [Guid](#)

A [Guid](#) that uniquely identifies the resource manager.

recoveryInformation [Byte\[\]](#)

Contains additional information of recovery information.

enlistmentNotification [IEnlistmentNotification](#)

A resource object that implements [IEnlistmentNotification](#) to receive notifications.

Returns

[Enlistment](#)

An [Enlistment](#) that describes the enlistment.

Exceptions

[ArgumentException](#)

`recoveryInformation` is invalid.

-or-

Transaction Manager information in `recoveryInformation` does not match the configured transaction manager.

-or-

`recoveryInformation` is not recognized by [System.Transactions](#).

InvalidOperationException

[RecoveryComplete\(Guid\)](#) has already been called for the specified `resourceManagerIdentifier`. The reenlistment is rejected.

TransactionException

The `resourceManagerIdentifier` does not match the content of the specified recovery information in `recoveryInformation`.

Remarks

Important

Calling this method with untrusted data is a security risk. Call this method only with trusted data. For more information, see [Validate All Inputs](#).

A resource manager facilitates resolution of durable enlistments in a transaction by reenlisting the transaction participant after resource failure.

The `resourceManagerIdentifier` parameter is used to consistently label the participant of a transaction in the event of a resource failure. When calling the [Reenlist](#) method, the resource manager must provide the same `resourceManagerIdentifier` as it used when it originally called the [EnlistDurable](#) method during enlistment, or a [TransactionException](#) is thrown.

When a participant is reenlisted using this method, the phase 2 methods of [IEnlistmentNotification](#) that correspond to the transaction's outcome (that is, [Commit](#), [Rollback](#), or [InDoubt](#)) are called as appropriate.

After the participants are successfully reenlisted, you should then call [RecoveryComplete](#) to complete the recovery.

You should only call this method when a resource manager restarts from failure. In addition, you should only reenlist unresolved transactions logged by a resource manager during the initial Prepare phase of a two-phase commit. Any attempt to call this method at invalid times can produce erroneous results.

If the transaction manager fails, and your resource manager performs recovery only a short time after you called the [Prepared](#) method on an enlistment in phase 1 of the Two-Phase Commit protocol, your resource manager might either receive the [InDoubt](#) or [Rollback](#) callback.

For more information on recovery, see [Performing Recovery](#)).
