# XamlReader.Parse Method

## Definition

Namespace: [System.Windows.Markup](#) Assembly:PresentationFramework.dll

Important

Some information relates to prerelease product that may be substantially modified before it's released. Microsoft makes no warranties, express or implied, with respect to the information provided here.

Reads the markup in the specified text string and returns an object that corresponds to the root of the specified markup.

## Overloads

| Name                                         | Description |
|----------------------------------------------|-------------|
| <a href="#">Parse(String, ParserContext)</a> |             |

Reads the XAML markup in the specified text string (using a specified [ParserContext](#)) and returns an object that corresponds to the root of the specified markup.

||| [Parse\(String\)](#) |

Reads the XAML input in the specified text string and returns an object that corresponds to the root of the specified markup.

||| [Parse\(String, Boolean\)](#) ||| [Parse\(String, ParserContext, Boolean\)](#) |||

## Parse(String, ParserContext)

Reads the XAML markup in the specified text string (using a specified [ParserContext](#)) and returns an object that corresponds to the root of the specified markup.

```
public:  
    static System::Object ^ Parse(System::String ^ xamlText,  
        System::Windows::Markup::ParserContext ^ parserContext);
```

```
public static object Parse(string xamlText, System.Windows.Markup.ParserContext  
    parserContext);
```

```
static member Parse : string * System.Windows.Markup.ParserContext -> obj
```

```
Public Shared Function Parse (xamlText As String, parserContext As ParserContext) As  
    Object
```

### Parameters

xamlText [String](#)

The input XAML, as a single text string.

parserContext [ParserContext](#)

Context information used by the parser.

### Returns

[Object](#)

The root of the created object tree.

### Remarks

The implementation calls [Load](#) internally after creating a stream from the string. See [Load](#) for additional information such as possible exceptions.

## Applies to

## Parse(String)

---

Reads the XAML input in the specified text string and returns an object that corresponds to the root of the specified markup.

```
public:  
    static System::Object ^ Parse(System::String ^ xamlText);
```

```
public static object Parse(string xamlText);
```

```
static member Parse : string -> obj
```

```
Public Shared Function Parse (xamlText As String) As Object
```

## Parameters

xamlText [String](#)

The input XAML, as a single text string.

## Returns

[Object](#)

The root of the created object tree.

## Remarks

The implementation calls [Load](#) internally after creating a stream from the string. See [Load](#) for additional information such as possible exceptions.

## Applies to

## Parse(String, Boolean)

---

```
public:  
    static System::Object ^ Parse(System::String ^ xamlText, bool useRestrictiveXamlReader);
```

```
public static object Parse(string xamlText, bool useRestrictiveXamlReader);
```

```
static member Parse : string * bool -> obj
```

```
Public Shared Function Parse (xmlText As String, useRestrictiveXmlReader As Boolean) As Object
```

## Parameters

xmlText [String](#)

useRestrictiveXmlReader [Boolean](#)

## Returns

[Object](#)

## Applies to

## Parse(String, ParserContext, Boolean)

---

```
public:  
    static System::Object ^ Parse(System::String ^ xmlText,  
    System::Windows::Markup::ParserContext ^ parserContext, bool useRestrictiveXmlReader);
```

```
public static object Parse(string xmlText, System.Windows.Markup.ParserContext  
parserContext, bool useRestrictiveXmlReader);
```

```
static member Parse : string * System.Windows.Markup.ParserContext * bool -> obj
```

```
Public Shared Function Parse (xmlText As String, parserContext As ParserContext,  
useRestrictiveXmlReader As Boolean) As Object
```

## Parameters

xmlText [String](#)

parserContext [ParserContext](#)

useRestrictiveXmlReader [Boolean](#)

## Returns

[Object](#)

## Applies to
